4733 Centre Avenue, Pittsburgh, PA, 15213, USA

## EDUCATION

**Carnegie Mellon University**

*Aug 2020 – Present*

Ph.D. Candidate in Chemical Engineering | GPA:4.0/4.0

Advisor: Prof. Ignacio E. Grossmann (Ph.D.)

# Incheon National University

Mar 2015 – Feb 2017

M.S. in Energy and Chemical Engineering | GPA:4.0/4.0

Advisor: Prof. Jiyong Kim (Ph.D.)

# Incheon National University

Mar 2011 – Feb 2015

B.S. in Energy and Chemical Engineering | GPA:3.7/4.0

## RESEARCH

## EXPERIENCE

**Ph.D. Student** | Carnegie Mellon University, Pittsburgh, PA

*Aug 2020 – Present*

Supervised by Prof. Ignacio E. Grossmann (Ph.D.)

## 1) Optimization model and algorithm for expansion planning of reliable power systems

- Proposed *Generalized Disjunctive Programming* (GDP) model for a long-term expansion planning with hourly-operation decisions, which can optimize both the main generation systems and reserve systems.
- Considered the impact of operational strategies of generations (including dual role of generators) on power systems reliability.
- Used a point failure probability and capacity failures states to estimate power systems reliability.
- Developed a bilevel decomposition with tailored cuts to reduce computational expenses, and proved the effectiveness of the decomposition with case studies.
- Perform a collaborative work with California Energy Commission to provide guidelines for establishing carbon-neutral and reliable power systems in California (On-going).

**2) Proactive capacity planning of transmission systems and redispatch of generation systems to prevent electricity supply disruptions (On-going)**

- Formulate a two-stage stochastic *Generalized Disjunctive Programming* (GDP) model for expansion planning of transmission systems under disruption.
- Consider line hardening and new installation as solution to improving resilience.
- Propose a method to generate different disruption scenarios considering extreme weather depending on transmission systems network.

**Master student** | Incheon National University, Incheon, South Korea

Mar 2015 – Feb 2017

Supervised by Prof. Jiyong Kim (Ph.D.)

## 1) Biomass-to-Hydrogen economy

- Developed an optimization-based decision making model for design and analysis of biomass based hydrogen energy supply network considering both waste biomass and dedicated energy crops.
- Evaluated the impact of biomass-based hydrogen energy systems in terms of economics and environmental impact.
- Proposed a multi-period and multi-sites mixed-integer linear programming (MILP) model for a long-term expansion planning of biomass-to-hydrogen supply chain networks.

## 2) Biofuel infrastructure development

- Proposed an MILP optimization model for the optimal selection of production technology and supply chain network
- Performed a case study of Jeju Island, South Korea, to evaluate the feasibility of different ethanol-gasoline blends scenarios.

**Undergraduate Research Student** | Incheon National University, Incheon, South Korea

Supervised by Prof. Jiyong Kim (Ph.D.)

Jan 2014 – Feb 2015

- Evaluated the impact of renewable energy systems using different evaluation criteria: economics, energy security, and environmental protection

WORK  
EXPERIENCE

**Researcher** | Innovation Center for Chemical Engineering, South Korea

Mar 2017 – Jul 2020

Supervised by Prof. Jiyong Kim (Ph.D.)

**1) Life Cycle Analysis (LCA) of enhanced coalbed methane recovery (ECBM) systems**

- Conducted Life Cycle Analysis (LCA) of  $CO_2$  enhanced coalbed methane recovery (ECBM) systems, which includes raw material capture/transportation,  $CO_2$  injection/ $CH_4$  extraction, purification, and solved a case study of Tavan Tolgoi basin, Mongolia.

**2) Knowledge-based platform development for early-state screening of catalysts**

- Developed a new computer-aided platform (called METAL (Methanol process: Techno-economic Analysis Laboratory)) to assess the technical and economic performances of  $CO_2$  hydrogenation catalysts in the early R&D stage of new catalyst discovery.
- Evaluated 38 types of  $CO_2$  hydrogenation catalysts reported in the literature using the platform, and provided a guideline for new discovery of catalysts.

**3) Techno-economic assessment of  $CO_2$  to methanol synthesis processes**

- Proposed two new methanol synthesis processes that use waste  $CO_2$  and renewable  $H_2$  as feedstock: advanced syngas-to-methanol (AS2M) and direct  $CO_2$ -to-methanol (DC2M) processes.
- Examined technical and economic capabilities of the two novel processes using four evaluation criteria: carbon efficiency, energy efficiency,  $CO_2$  reduction, and unit production cost.
