EDUCATION

Carnegie Mellon University

Aug 2020 – Present

Ph.D. Candidate in Chemical Engineering | GPA:4.0/4.0

Advisor: Prof. Ignacio E. Grossmann (Ph.D.)

Incheon National University

Mar 2015 – Feb 2017

M.S. in Energy and Chemical Engineering | GPA:4.0/4.0

Advisor: Prof. Jiyong Kim (Ph.D.)

Incheon National University

Mar 2011 – Feb 2015

B.S. in Energy and Chemical Engineering | GPA:3.7/4.0

RESEARCH

EXPERIENCE

Ph.D. Student | Carnegie Mellon University, Pittsburgh, PA

Aug 2020 – Present

Supervised by Prof. Ignacio E. Grossmann (Ph.D.)

1) Optimization model and algorithm for expansion planning of reliable power systems

- Proposed *Generalized Disjunctive Programming* (GDP) model for a long-term expansion planning with hourly-operation decisions, which can optimize both the main generation systems and reserve systems.
- Considered the impact of operational strategies of generations (including dual role of generators) on power systems reliability.
- Used point failure probability and capacity failures states to estimate power systems reliability.
- Developed a bilevel decomposition with tailored cuts to reduce computational expenses, and proved the effectiveness of the decomposition with case studies.
- Perform a collaborative work with California Energy Commission to provide guidelines for establishing carbon-neutral and reliable power systems in California (On-going).

2) Proactive capacity planning of transmission systems and redispatch of generation systems to prevent electricity supply disruptions (On-going)

- Formulate a two-stage stochastic *Generalized Disjunctive Programming* (GDP) model for expansion planning of transmission systems under disruption.
- Propose a method to generate different disruption scenarios considering extreme weather depending on transmission systems network.

Master student | Incheon National University, Incheon, South Korea

Mar 2015 – Feb 2017

Supervised by Prof. Jiyong Kim (Ph.D.)

1) Biomass-to-Hydrogen economy

- Developed an optimization-based decision making model for design and analysis of biomass based hydrogen energy supply network considering both waste biomass and dedicated energy crops.
- Proposed a long-term expansion planning of biomass-to-hydrogen supply chain networks.

2) Biofuel infrastructure development

- Proposed an optimization model for the optimal selection of production technology and supply chain network, and performed a case study of Jeju Island, South Korea, to evaluate the feasibility of different ethanol-gasoline blends scenarios (e.g., E10: 10% ethanol and 90% gasoline).

Undergraduate Research Student | Incheon National University, Incheon, South Korea

Supervised by Prof. Jiyong Kim (Ph.D.)

Jan 2014 – Feb 2015

- Evaluated the impact of renewable energy systems using different evaluation criteria: economics, energy security, and environmental protection

WORK EXPERIENCE

Researcher | Innovation Center for Chemical Engineering, South Korea
Supervised by Prof. Jiyong Kim (Ph.D.)

Mar 2017 – Jul 2020

1) Life Cycle Analysis (LCA) of enhanced coalbed methane recovery (ECBM) systems

- Conducted Life Cycle Analysis (LCA) of CO_2 enhanced coalbed methane recovery (ECBM) systems, which includes raw material capture/transportation, CO_2 injection/ CH_4 extraction, purification, and solved a case study of Tavan Tolgoi basin, Mongolia.

2) Knowledge-based platform development for early-state screening of catalysts

- Developed a new computer-aided platform (called METAL (Methanol process: Techno-economic Analysis Laboratory)) to assess the technical and economic performances of CO_2 hydrogenation catalysts in the early R&D stage of new catalyst discovery.
- Evaluated 38 types of CO_2 hydrogenation catalysts reported in the literature using the platform, and provided a guideline for new discovery of catalysts.

3) Techno-economic assessment of CO_2 to methanol synthesis processes

- Proposed two new methanol synthesis processes that use waste CO_2 and renewable H_2 as feed-stock: advanced syngas-to-methanol (AS2M) and direct CO_2 -to-methanol (DC2M) processes.
- Examined technical and economic capabilities of the two novel processes using four evaluation criteria: carbon efficiency, energy efficiency, CO_2 reduction, and unit production cost.
